Erythrocyte membrane composition in patients with primary hypercholesterolemia

A. Vayá a,*, M. Martínez Triguero a, E. Réganon b, V. Vila b, V. Martínez Sales b, E. Solá c and A. Hernández Mijares c

a Hemorheology and Thrombosis Unit, La Fe University, Valencia, Spain
b Research Centre, La Fe University, Valencia, Spain
c Dr. Peset University Hospital, Valencia, Spain

[Clinical Hemorheology and Microcirculation 40(4) (2008), 289–294]

Author A. Ricart was omitted from the list of authors. Complete list of authors and their affiliations should be:

A. Vayá a,*, M. Martínez Triguero a, E. Réganon b, V. Vila b, V. Martínez Sales b, E. Solá c, A. Hernández Mijares c and A. Ricart d

a Hemorheology and Thrombosis Unit, La Fe University, Valencia, Spain
b Research Centre, La Fe University, Valencia, Spain
c Dr. Peset University Hospital, Valencia, Spain
d Department of Applied Linguistics, Polytechnic University of Valencia, Valencia, Spain

Additionally, the name of Dr. A. Ricart should be removed from the Acknowledgements.

Furthermore, 2 references were missing from the list of references and should be added:

Consequently, all references in this list and in the text will move up 2 places from reference [10] onward.

The Introduction of the article should read:

1. Introduction

The influence of plasmatic lipids on rheological blood behaviour have been extensively investigated [1–7]. Different studies have found that patients with familial hypercholesterolemia have a higher cholesterol/phospholipid (Chol/Ph) ratio in their red cell membranes [8–11], which is possibly associated with a high plasma cholesterol and the corresponding increase in the lipoproteins that exchange LDL cholesterol with that of the red cell membrane [12].
