The vibrant direction of Singapore’s future is clearly focused on its Masterplan: An Intelligent Nation, A Global City, Powered by Infocomm. This city-state of some 5 million has not only set ambitious goals to accomplish by 2015, it already has many important achievements to record.

The Singapore 2015 Strategy incorporates the full range of essential components essential for transforming the country. These are (1) to establish an ultra-high speed, pervasive, intelligent and trusted info-comm infrastructure; (2) to develop a globally competitive info-comm industry, (3) to develop an info-comm-savvy workforce and globally competitive info-comm manpower, and (4) to spearhead the transformation of key economic sectors, government and society through more sophisticated and innovative use of info-comm.

The Infocomm Development Authority (IDA) of Singapore has been directing many of the transformative initiatives to and designed an integrated approach to developing info-comm in the country. Although the objectives and approaches of the Singapore plan are not unique among developed countries, the parallel pursuit of programs to create a competitive telecom market, strong involvement by business in info-comm enterprises in expanded trade, and extensive programs involving the society, may be the most ambitious of any nation.

It is no surprise, therefore, that Singapore consistently ranks very high on the e-Government ranking scales of the United Nations, Waseda University, World Economic Forum and other organizations.
