Erratum

P. Melchers*, A. Maluck, L. Suhr, S. Scholten and G. Lehmkuhl

Our paper contains an error in the labeling of Fig. 3 (Quality of Life assessment), which may lead to substantial misinterpretation. In questions 3 ('Did the treatment and consulting with the therapists influence your bearing and dealing with the trauma and its consequences? Did it become easier or more difficult?') and 4 ('Did your active role in the treatment make your bearing of the situation easier or more difficult?') the labels Easier and More Difficult were erroneously reversed. As correctly stated in the Discussion, parents found the additional therapeutic support and their active participation in the treatment to be helpful in coping with their situation of facing a severely traumatized child.
