INTRODUCTION

The Journal of High Speed Networks is a welcome addition to the field. High speed networking will be the core of the information infrastructure of the twenty-first century. Already, considerable progress in research and development has made it possible to deploy networks which can communicate over computer networks at a rate of a billion bits per second or more. The Journal will cover network issues, design choices, practical experience and other emerging timely and related topics in local and wide-area high speed networks. Any practitioner of the field will surely benefit from access to this publication.
