

Introduction

We are pleased to present another issue of *NeuroRehabilitation*, focusing on a variety of topics. Subjects especially relevant to clinical practice are discussed. Within this issue, Forrest and Qian review clinical studies on the efficacy of exercise in neuromuscular disease. Certo and her colleagues report on functional ambulation in senior adults. Bowen et al. present research on a community based intervention program for persons with traumatic brain injury, while Parente and colleagues present their research retraining work-

ing memory. Burnett et al provide a review of pharmacologic treatment of agitation. Finally, in a case study by Brokaw, Cifu, and Hardman, treatment of four-extremity deep venous thrombosis is discussed.

As always we appreciate the contributions of professionals in the field. We are confident you will find the information contained in this issue to be both enlightening and practical.
