

Supplementary Material

A Case of Logopenic Variant of Primary Progressive Aphasia with Parkinsonism and Anosmia

Supplementary Figure 1. 3D-SSP images showed a significant reduction of cerebral blood flow, especially in the left temporo-parietal areas, and to a lesser extent, in the posterior cingulate gyrus and precuneus with left side predominance. Z-score means the range of cerebral blood flow reduction compared with age-matched normal controls. The colored bar shows the Z-score.
