Erratum

Hyperhomocysteinemic Mice Show Cognitive Impairment Without Features of Alzheimer’s Disease Phenotype

Bryce C. Rhodehouse, Michelle A. Erickson, William A. Bank and Shawn E. Bearden

Figure 4 (page 63) and 5 (page 64) of this article were printed incorrectly. What is printed as Fig. 4, is actually the figure for Fig. 5. What is printed as Fig. 5 is a duplicate of Fig. 6.

The correct Figs. 4 and 5 are represented below.

![Figure 4](image1)

**Fig. 4.** Brain Aβ42. Levels of Aβ42 in brains of mice with mild hyperhomocysteinemia due to heterozygosity of the cbs gene (HHcy, cbs+/−) and age-matched controls (Ctrl, cbs+/+). Two brain fractions were studied: cortex/hippocampus (Cor + Hip) and midbrain/diencephalon (Mid + Dien). ∗p < 0.05 for effect of age in the midbrain/diencephalon fractions. No other significant differences.

![Figure 5](image2)

**Fig. 5.** Aβ40 levels in the hippocampus of old mice. Levels of Aβ40 in brains of mice with mild hyperhomocysteinemia due to heterozygosity of the cbs gene (HHcy, cbs+/−) and age-matched controls (Ctrl, cbs+/+). Two fractions were quantified: sodium dodecyl sulfate (SDS; often called ‘soluble’) and formic acid (FA; often called ‘insoluble’). ∗p < 0.05 FA vs. SDS.
