^a The Consortium to Establish a Registry for Alzheimer's Disease (CERAD) neuropsychological battery plus (NB+)

R, A β ₄₂/A β ₄₀ ratio; MMSE, Mini-Mental State Examination; DR, Delayed Recall; Δ Baseline, Difference at baseline compared to ES w/o R 0; Δ Slope, Difference in longitudinal slope compared to ES w/o R 0

Supplementary Figure 1. Study population flow chart

CNS, central nervous system; CSF, cerebrospinal fluid

Supplementary Figure 2. Comparison of dementia risk between the Erlangen Score groups without the A β ₄₂/A β ₄₀ ratio. Kaplan-Meier curves show the risk of dementia onset in nondemented individuals (A) for the different ES groups when the A β ₄₂/A β ₄₀ ratio is not accounted. Nondemented individuals with an ES of 2 or higher showed an increased risk of dementia onset compared with controls. The hazard ratios of groups 2 and 3 in univariate and a multivariate Cox regression model with age, education, and MMSE at baseline as covariates were also found to be significantly increased in comparison with the control group.
