Physiological responses of core and skin temperature of two age groups to working in the cold at $+3^\circ \text{C}$ and $-24^\circ \text{C}$

Karsten Kluth, Mario Penzkofer and Helmut Strasser

Ergonomics Division, University of Siegen, Germany

When this article was originally published, Figures 4 and 5 were incorrect. They are reproduced correctly here.

---

**Fig. 4.** Tympanum (core) temperature changes [K] of male order-pickers prior to, during and after cold exposures of 80, 100, and 120 min at approx. $-24^\circ \text{C}$ in the cold store. Means of 15 Ss in two age groups, each, with symbolic labeling of statistically significant differences of the two-sided t-test (–: $p \geq 0.05$, *: $p < 0.05$, **: $p < 0.01$, ***: $p < 0.001$).

**Fig. 5.** Tympanum (core) temperature changes [K] of male order-pickers prior to, during and after cold exposures of 80, 100, and 120 min at approx. $+3^\circ \text{C}$ in the chill room. Means of 15 Ss in two age groups, each, with symbolic labeling of statistically significant differences of the two-sided t-test (–: $p \geq 0.05$, *: $p < 0.05$, **: $p < 0.01$, ***: $p < 0.001$).
