

From the Editor

Do you have a *Bucket List*? I have been keeping a *Bucket List* for more than 25 years. On this list are experiences and achievements that I hope to accomplish during my lifetime such as climbing the Great Wall of China, swimming with the sea turtles in the Galapagos Islands, snorkeling at the Great Barrier Reef, seeing the Taj Mahal at sunrise, and taking photographs of lavender fields in Provence. As you can tell from this list, I love to experience travel. Still other items on my *Bucket List* relate to work and academic pursuits like writing children's books which help to promote a better understanding of social justice and disability awareness to children; conducting research studies related to ergonomics that ultimately give us a better understanding on how to promote health and well-being among children; and starting an interdisciplinary and international journal to disseminate evidence based research and science driven clinical practice to better understand the construct of work. I am happy to share that this last item on my *Bucket List* was achieved in 1990 and now after 23 years, *WORK* continues to advance our understanding of work.

This issue of *WORK* contains 11 articles. Xu, Cheng and Li-Tsang start the issue with a systematic review of the prevalence and risk factors of work-related musculoskeletal disorders in the catering industry. Lapointe, Dionne, Brisson and Montreuil also investigated musculoskeletal symptoms in their study which looked at the interaction of effort-reward imbalance and video display unit postural risk factors in women.

Laisné, Lecomte and Corbière shared a prospective study of the biopsychosocial determinants of work outcomes from workers with occupational injuries who received compensation.

We have multiple articles which address return to work. Jakobsen and Svendsen provided an employers' perspective when return to work is the objective for persons with spinal cord injuries. Jensen provided an

interesting parsimonious program theory of return to work intervention which set the stage for a two-year follow-up on this program theory of return to work intervention.

Lindahl, Hvalsoe and Poulsen discussed the importance of partnership for the delivery of quality care in rehabilitation after fracture for adults at working age.

Saade and Marchand shared the moderating role of personality traits in work organization conditions and the misuse of alcohol.

Soeker, Carriem, Hendricks, Joynt and Naidoo described breaking into the world of employment South African male ex-offenders.

Cohen, Suri, Amick and Yan investigated clinical and demographic factors associated with employment status in US military veterans returning from Iraq and Afghanistan.

Adding to the growing body of knowledge on children and their use of technology, Jacobs et al. describe the preliminary outcomes of an ergonomics training program for student notebook computer users.

The issue concludes with an article by Sutarto, Wahab and Zin which investigated the effect of biofeedback training on operator's cognitive performance.

Do you have writing an article for *WORK* on your *Bucket List*? I look forward to your submission!
